

# What does Gaggle content analysis look for?

Created by Corey Tutewiler

Last updated Jul 20, 2016

Gaggle's content analysis consists of a Blocked Word List, Anti-Pornography Scanner and Blocked Domains List.

## *Blocked Word List*

All communication within Gaggle is scanned against a Blocked Word List. Gaggle's Blocked Word List contains words and phrases that have been deemed inappropriate. This list is updated frequently by Gaggle Safety Representatives to remain up-to-date with current trends.

With the Premium version of Safety Management, customers can customize their Blocked Word List, adding regional or localized words or slang. A Spanish blocked word list is available, as well.

## *Anti-Pornography Scanner*

The Gaggle Anti-Pornography Scanner (APS) is used to detect pornography in files and on web sites. The scanner will look at attached images, embedded images and even URL's to determine the likelihood that the image is pornographic or not. Gaggle offers one of the highest degrees of CIPA compliance of any email provider and is one of a few systems that meet the CIPA requirement to block "visual depictions that are obscene; child pornography; or are harmful to minors."

## *Blocked Domains List*

Over the past several years, Gaggle has put together a list of email domains that in all cases send either malicious or inappropriate messages to student accounts. When Gaggle identifies these domains, students will not receive messages from them.
